Title: Perfectioning in automatic coupling systems for laminated bands or paper coils

Abstract: Automatic coupling system for laminated bands, perfected because it has a movable support for the coils. Based on the fact that the coil support has two parallel axes, related one to the band of the coil that is ending and the other to the coil that is being started, in such a way that at a certain moment they are made to rotate at a previously established speed, which allows to carry out the adequate cutting and coupling on the band that is ending, through their own braking and cutting means and at the same time both supports are separated to their normal position to leave them ready for a new coupling.
